

PROJECT REPORT

Auto Ticket Classification using Flow Designer

ServiceNow Automation Project

Submitted By: Saadhika K G, Nivetha M, Blessey Kiruba B, Harisha S

Team / Group: Team 18

Institution: Velammal Institute of Technology

Academic Year: 2026–2027

1. Abstract

The project titled **Auto Ticket Classification using Flow Designer** is designed to automate the classification of school IT helpdesk tickets in ServiceNow. The system evaluates keywords in the Short Description of a newly created ticket and automatically assigns an appropriate Category and Subcategory. It also sends an email notification to the caller after the request is submitted. The project uses a custom Incident WorkFlow table, dependent choices, Flow Designer automation, and an Update Set for deployment.

2. Problem Statement

Manual classification of school IT support tickets can require repeated effort from support staff. The project addresses this by automatically identifying common IT issues from the ticket description and assigning structured classification values.

3. Objectives

- Automatically classify IT support tickets.
- Assign Category and Subcategory based on ticket keywords.
- Implement dependent choice logic between Category and Subcategory.
- Send an email notification to the caller after submission.
- Store ticket information in a structured custom table.
- Provide a maintainable and scalable Flow Designer automation.

4. Requirements and Planning

The project uses ServiceNow and Flow Designer. The implementation begins by creating a Local Update Set, followed by a custom table named **Incident WorkFlow**. The table stores caller, classification, description, state, and assignment information.

5. Custom Table and Fields

The custom table contains the following fields:

Field	Type	Purpose
Number	Auto Number	Unique ticket number
Caller	Reference (sys_user)	Stores the caller
Category	Choice	Main issue category
Subcategory	Choice	Specific issue type
Short Description	String	Short issue description
Description	String	Detailed issue description
State	Choice	Ticket status
Assigned Group	Reference (sys_user_group)	Support group
Assigned to	Reference (sys_user)	Assigned person

6. Choice Values and Dependency

Category: Network, Hardware, Access, Performance.

Subcategory: Wi-Fi, Projector, Forgot Password, Slow Computer.

State: New, In progress, On hold, Resolved, Closed.

The Subcategory field is configured as dependent on Category. The mappings are:

Category	Subcategory
Network	Wi-Fi
Hardware	Projector
Access	Forgot Password
Performance	Slow Computer

7. Flow Designer Automation

A Flow named **Auto Classify School IT Tickets** is created in the Global application. The trigger is Record Created for the Incident WorkFlow table, with the condition that Category is empty.

Classification Logic

Short Description Keyword	Category	Subcategory
Wi-Fi / Network	Network	Wi-Fi
Projector	Hardware	Projector
Forgot password	Access	Forgot Password
Slow Computer	Performance	Slow Computer

8. Email Notification

After classification, the flow uses the Send Email action. The recipient is the caller's email address. The configured subject is: **Your Request for the issue has been submitted.** The email body provides a ticket submission confirmation.

9. Testing and Validation

The project specifies validation using sample tickets to confirm that the Flow Designer automation correctly updates the Category and Subcategory and generates an email notification.

Test	Input Short Description	Expected Category	Expected Subcategory
Test 1	WiFi not working in library	Network	Wi-Fi
Test 2	Projector not turning on	Hardware	Projector

10. Deployment

After testing, the Project Update Set is opened from Local Update Sets. Its State is changed to Complete, saved, and then exported to XML using the Export to XML related link. The exported XML can be retained

for project sharing and deployment.

11. Project Workflow

Student creates ticket → Record Created trigger → Category is empty → Flow checks Short Description → Category and Subcategory are updated → Email notification is sent.

12. Conclusion

The Auto Ticket Classification using Flow Designer project provides an automated approach for classifying common school IT support tickets. By using a custom table, dependent choices, Flow Designer conditions, record updates, email notification, and an Update Set, the project establishes a structured workflow for handling the defined ticket categories. The validation scenarios demonstrate the intended classification behavior for Wi-Fi and Projector requests.

13. Project Deliverables

- ServiceNow custom Incident WorkFlow table
- Auto Classify School IT Tickets Flow
- Dependent Category/Subcategory choices
- Email notification configuration
- Validation test records
- Completed Project Update Set exported as XML
- Project documentation and presentation
